IMPORTANT NOTICE

This manual has been provided for the use of authorized Yamaha Retailers and their service personnel. It has been assumed that basic service procedures inherent to the industry, and more specifically Yamaha Products, are already known and understood by the users, and have therefore not been restated.

WARNING: Failure to follow appropriate service and safety procedures when servicing this product may result in personal injury, destruction of expensive components and failure of the product to perform as specified. For these reasons, we advise all Yamaha product owners that all service required should be performed by an authorized Yamaha Retailer or the appointed service representative.

IMPORTANT: The presentation or sale of this manual to any individual or firm does not constitute authorization, certification, recognition of any applicable technical capabilities, or establish a principle-agent relationship of any form.

The data provided is believed to be accurate and applicable to the unit(s) indicated on the cover. The research, engineering, and service departments of Yamaha are continually striving to improve Yamaha products. Modifications are, therefore, inevitable and changes in specification are subject to change without notice or obligation to retrofit. Should any discrepancy appear to exist, please contact the distributor's Service Division.

WARNING: Static discharges can destroy expensive components. Discharge any static electricity your body may have accumulated by grounding yourself to the ground buss in the unit (heavy gauge black wires connect to this buss).

IMPORTANT: Turn the unit OFF during disassembly and parts replacement. Recheck all work before you apply power to the unit.

■ Specifications

CPU

CPU:	Z80A compatible
Clock:	3.579545 MHz
Wait:	1 wait in M1 cycle
Interrupt:	INT external and VDP. NMI interrupt no used. (In MSX-BASIC interpreter 60Hz signal from VDP is used for the interrupt.) (MODE 1)
Reset:	Power on reset

MEMORY

Main memory:	32KB
Video RAM:	16KB
ROM:	32KB (MSX-BASIC)

VIDEO DISPLAY

Character set:	256 alphanumeric and graphic characters
Color:	16 colors
Text Display	
Capability:	24 lines by up to 40 columns (Software selectable)
Resolution:	256 dots X 192 lines (non-interlace)

INPUT AND OUTPUT

Keyboard:	Stroke type step sculpture keyboard. Special characters and Alphanumeric characters 48 Control and special effect keys . . 16 Cursor movement keys 4 Function keys (programmable) . . . 5 CAPS lock key with LED indication
-----------	---

Audio Cassette Interface: 8 pin DIN female connector
 Baud rate 1200/2400 BPS switchable by software, FSK format
 With remote control (Cassette motor ON/OFF)

Printer Interface: Standard Centronics 8-bit parallel
 TTL logic level
 14 pin female connector

Universal I/O Interface (JOYSTICK etc.): 2 ports
 9 pin connectors (male) X 2
 TTL logic level

Monitor Output: 1) 5 pin DIN female connector
 2) NTSC composite video output
 75 ohms Use video cable (VC-02)
 3) Sound output
 8 octaves/3 notes + noise (-5dB)
 The SSG is YM2149
 Beep sound (PPI: μ PD8225C-5)
 4) Monitor output
 Use monitor connector (RF-02)

Upper Slot (SLOT #1): 50 pin MSX standard female connector

Rear Slot (SLOT #2): 50 pin edge-card connector

FM sound synthesizer unit
 60 pin edge-card connector
 Number of Preset Voices: 46

Simultaneous Notes:
 Up to 8 notes
 Audio L/R Outputs:
 -9 \pm 2dB, 1.8k Ω
 RCA-pin jacks
 MIDI IN/OUT:
 5 pin DIN female connectors
 Music keyboard:
 For connection to an optional YK-01 or YK-10 music keyboard.
 20 pin male connector

POWER SUPPLY UNIT CAPACITY

+ 5V \pm 5% 1.8A
 +12V \pm 10% 0.3A
 -12V \pm 10% 0.16A

GENERAL SPECIFICATIONS

Line Voltage: 120V AC (Minimum 90V, Maximum 132V)

Power Consumption: 30 watts maximum

Dimensions: 16.7" wide X 2.7" high X 8.2" deep
 (423mm wide X 68mm high X 208mm deep)

Weight: 7.7 pounds (3.5kg)

Accessory

Cassette interface cable
 Computer side 8 pin DIN male connector
 Cassette recorder side
 Mini-phone plug Mini phone plug (3.5 ϕ)
 Mic plug Mini phone plug (3.5 ϕ)
 Remote control plug Mini phone plug (2.5 ϕ)
 Length: 1 m

■ MSX Brief Description

CPU (Z80A)

A 10.73635 MHz clock is originated in the VDP and divided by three to produce a 3.579545 MHz system clock which is fed to the CPU. Thus one clock cycle is approximately 279nsec. Address bus (16 bits) and data bus connected to the peripheral devices and other external units.

One WAIT cycle is inserted per each M1 cycle (fetch instruction cycle). A WAIT cycle can also be inserted through slots # 1 ~ # 3.

As for the interrupt, NMI is not used, and the INT (interrupt) mode 1 is used. INT from VDP and external INT(s) from slots # 1 ~ # 3 are input to an OR gate and then fed to CPU INT line. 60 Hz interrupt signal is output from VDP to initiate each 1/60 of a second for the screen control or keyboard scan.

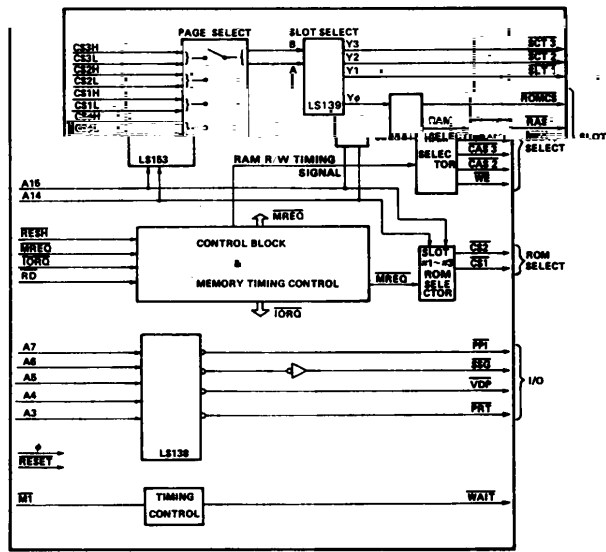

MMC (MSX Memory Controller – YM5214)

This is a dedicated LSI for MSX, and was developed by Yamaha.

Based on the MSX specifications, the memory bank select uses standard I/O M1 WAIT instruction generation.

MMC BLOCK DIAGRAM

YM5214 BLOCK DIAGRAM

VDP (Video Display Processor – TMS9918A)

The VDP supports 16K bytes of V-RAM (Video RAM). It produces a composite video signal for a TV display according to the CPU instructions. A 10.738636 MHz clock generated within the VDP is divided by three to be used as a system clock for various peripherals.

SSG (Software Sound Generator – YM2149)

The SSG is compatible to General Instrument's PSG (AY3-8910) and was enhanced, designed and developed by Yamaha. It can produce up to 3 notes and noise by software control. It also has two 8 bit universal I/O ports for joystick and other peripherals.

PPI (Programmable Peripheral Interface – μ PD8255A)

Three 8 bit universal I/O ports A, B and C are provided.

Each port may be controlled by software, and the following functions are assigned as a specification.

Port A: Memory bank signal output.

Port B: Keyboard scan signal input.

Port C: Keyboard strobe signal output, CAPS lock LED switch, cassette data recorder control, etc.

Memory map and slot

ROM: 32 byte MSX BASIC ROM on slot 0, address 0000H ~ 7FFFH.

RAM: DRAM (Dynamic RAM) of 16K bytes X 2 (total of 32K bytes) on slot 0, address 8000H ~ FFFFH.

V-RAM: 16 K bytes of V-RAM are separated from the system bus and supported by the VDP.

SLOT SELECT SIGNAL OF PPI PORT A

• I/O port memory map

According to the MSX specifications, the 256 byte Z-80A I/O port area from 00H to FFH is reserved for the standard MSX system devices as follows:

PPI input/output port

When MSX-BASIC is operating, the mode is set to MODE 0 (PA0 ~ PA7, PB0 ~ PB7 and PC0 ~ PC7 can be controlled as independent 8-bit ports) and each port controls the following input/output.

PA0 ~ PA7: Output port to MMC (sends out data to produce slot select signal).

PB0 ~ PB7: Input port for keyboard scanning data.

PC0 ~ PC3: Sends scanning signal to keyboard through an LS145 IC.

PC4: Motor ON/OFF control data recorder (cassette). Turns relay.

PC5: Output FSK specification data to data recorder (cassette).

PC6: LED lights at CAPS lock LED "L".

PC7: Emits beeping sound through 1 bit output.

SSG input/output port

This LSI can be programmed to play up to 3 notes as well as noise, and at the same time, controls the next input/output unit by means of the two input/output ports.

CHA ~ CHC : Triple chord output terminal and noise output terminal.

IOA0 ~ IOA5: Input port for general purpose. Input/output port (JOYSTICK 1, 2) data scanning.

IOA6: LED lights at CODE, locks LED "L"

IOA7: Input port for data from data recorder (cassette).

IOB0 ~ IOB6: General purpose input/output port (JOYSTICK 1, 2) select, and strobe & scanning.

IOB0 ~ IOB3: Port scanning data output

IOB4: JOYSTICK 1 strobe signal output

IOB5: JOYSTICK 2 strobe signal output

IOB6: JOYSTICK 1, 2 select signal

IOB "L" JOYSTICK 1 select

IOB "H" JOYSTICK 2 select

IOB7: Not used

The specified functions of the PPI and SSG input/output ports as described above are all set by the inner monitor when power ON reset and MSX-BASIC functions are in operation (without anything inserted in the slot).

SLOT #3 (FM Sound Synthesizer Unit)

Pin No.	Pin Name	I/O	Description
1~10			Not used
11~60			Exactly same as 50-pin assignment as above.

• Slot management

Terminology: Primary slot Slot which is enabled by slot select register within 8255 PPI.
 Secondary slot Slot which is enabled by expansion slot register placed at 0FFFFH.
 Page Block of memory (maximum 16K) in each slot.
 A slot is divided into 4 pages.
 (0000H to 3FFFH, 4000H to 7FFFH, 8000H to 0BFFFH, 0C000H to 0FFFFH)

1. Minimum configuration

- a) Microsoft MSX BASIC interpreter at slot #0 from 0000H to 7FFFH.
- b) Minimum of 8K RAM from 0E000H to 0FFFFH in any slot (including the secondary slot).

2. RAM search procedure

MSX BASIC first searches for available RAM from 0BFFFH down to 8000H (including the ones in secondary slots), then enables the page containing the largest RAM. If there are more than one such pages, selects the leftmost page in the figure above. MSX BASIC next searches for available RAM from 0FFFFH down to 0C000H, and does the same thing described above. Finally, MSX BASIC searches for continuous RAM block from 0FFFFH down to 8000H and sets the system variable "BOTTOM".

3. Program cartridge search procedure

MSX BASIC scans all slots (including secondary slots) from 4000H to 0BFFFH for a valid ID at the beginning of each page, collects information, and passes control to each page. The scan order is from left to right in the figure above. The format of ID and others are as follows.

Offset from top

+0000H	
+0002H	ID
+0004H	INIT
+0006H	STATEMENT
+0008H	DEVICE
+000AH	TEXT
+0010H	reserved

cartridges from empty pages. "AB" (41H, 42H) is used for this purpose.

procedure specific to the cartridge and holds 0 when the user procedure is not operating with BASIC interpreter should return control to it by the Z80's [stack pointer] can be destroyed). However other programs (such as game interpreter.

IC encounters a 'CALL' statement, it calls this address with the statement name in

uch text is inside.
the program. The

TEXT holds the beginning address of BASIC. Text is contained in the cartridge, but holds 0 when no st
BASIC regards this as the beginning address of BASIC text, sets pointer there, and begins execution of
following are notes to be considered.

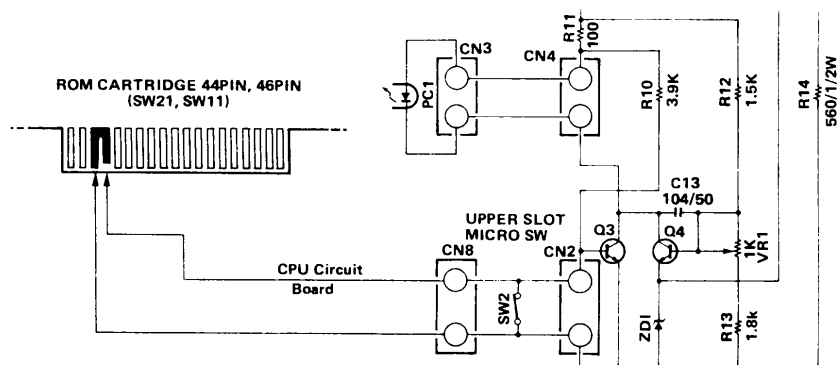

1) When there is more than one slot, only the first one (in the figure of memory structure of WSA above) is added
and executed.

- 2) The cartridge must be placed at 8000H ~ 0BFFFH, thus the maximum length of BASIC text cannot exceed 16 Kbytes.
- 3) Even if there is a RAM block equipped at 8000H ~ 0BFFFH, it can never be used.
- 4) The address pointed to by the TEXT entry must contain a zero.
- 5) The line numbers (for statements which reference line numbers, such as GOTO, GOSUB, etc.) must be translated to pointers in advance because they cannot be converted to pointers when executed. They can be line numbers, however the execution would become slower.

NOTE: INIT, STATEMENT, DEVICE and TEST are placed in the low order byte first.

• Operation of Cartridge Protection

The power supply circuit of this unit is a self start RC circuit type and specified secondary voltage is given by the feedback of PC-1 as shown to the figure. In the cartridge protector circuit, SW2 is shorted when the ROM cartridge is not inserted in the upper slot. For this reason, Q3 is non operating. When the cartridge is inserted, SW2 become open, Q3 is ON. In the result, the voltage supply stops. After that, when the cartridge is fully put in, Q3 turns OFF and power is supplied because pin 44 (SW21) and pin 46 (SW11) are shorted.

- Operation of Power Supply Unit

The following is the description and operation of the power supply circuit.

1. In power supply circuit, D4, C4 and R5 are the base drive circuits, and the base current of Q2 is determined by R5.
2. Q1 operates as a voltage controller and a cartridge protector.
3. The photocoupler (PC1) feeds the voltages fluctuation of +5V back to the control circuit through the error detection circuit at all times. The control circuit controls output based on the information fed back, by increasing and decreasing the base current of Q1 and changing the oscillating frequency of Q2.
4. VR1 connected to the base of Q4 in the error detection circuit adjusts the output voltage (+5V).
5. SW2 connected to Q3 in the cartridge protector circuit is ON at all times. Therefore, Q3 remains OFF normally.
6. When power is ON and the ROM cartridge is set in the upper slot incorrectly, SW2 is turned OFF. Therefore, Q3 is turned ON, and the current flowing in the photocoupler (PC1) increases. The photocoupler (PC1) on the control circuit is turned ON to turn ON Q1. The oscillating frequency of Q2 increases, and the energy stored in L decreases, and output voltage lowers. When the ROM cartridge is properly set afterwards, pins 44 and 46 of ROM cartridge are short-circuited, and voltage increase again.
7. Overcurrent protection resistor R4: When excess current flows on the load side, current in proportion to it flows in Q2. At this time, R8 voltage also increases, which increases the base current of Q1 through R4. Consequently, the oscillating frequency of Q2 increases and output voltage is decreases. The oscillating frequency of Q2 is about 45 KHz.

- Disassembly Procedures

- Case removal

- 1) Remove three screws from the bottom case. Refer to reference ①.
- 2) Lift the front end of the keyboard case and remove it. Disconnect the shield wire from the shield plate of the CPU at the right front and left side. Also, disconnect the keyboard cable to the CPU board by gently pulling it up.
- 3) Remove five screws (two long ones and three short ones) from the bottom case and lift the case to disconnect the connector from the upper slot.

- CPU board removal

- 1) Remove the side slot screws from the bottom case and remove the FM sound synthesizer unit.
- 2) Remove seven screws securing the shield plate of the CPU board, move it to the right a little and lift it up.
- 3) Remove the side slot shield plate of the CPU board.
- 4) Remove the rear slot cover.
- 5) Remove CN2 (8 pin) from the CPU board.
- 6) Remove three screws from the upper slot connector.
- 7) Remove the CPU board by lifting its left side and pulling it to the left a little.

● **Power supply unit removal**

- 1) Remove two screws from the power supply unit.
Remove the shield plate and power supply unit by lifting the right side of the shield plate and pulling it to the right a little.
- 2) Remove two screws from the cord stopper and remove the power supply unit.

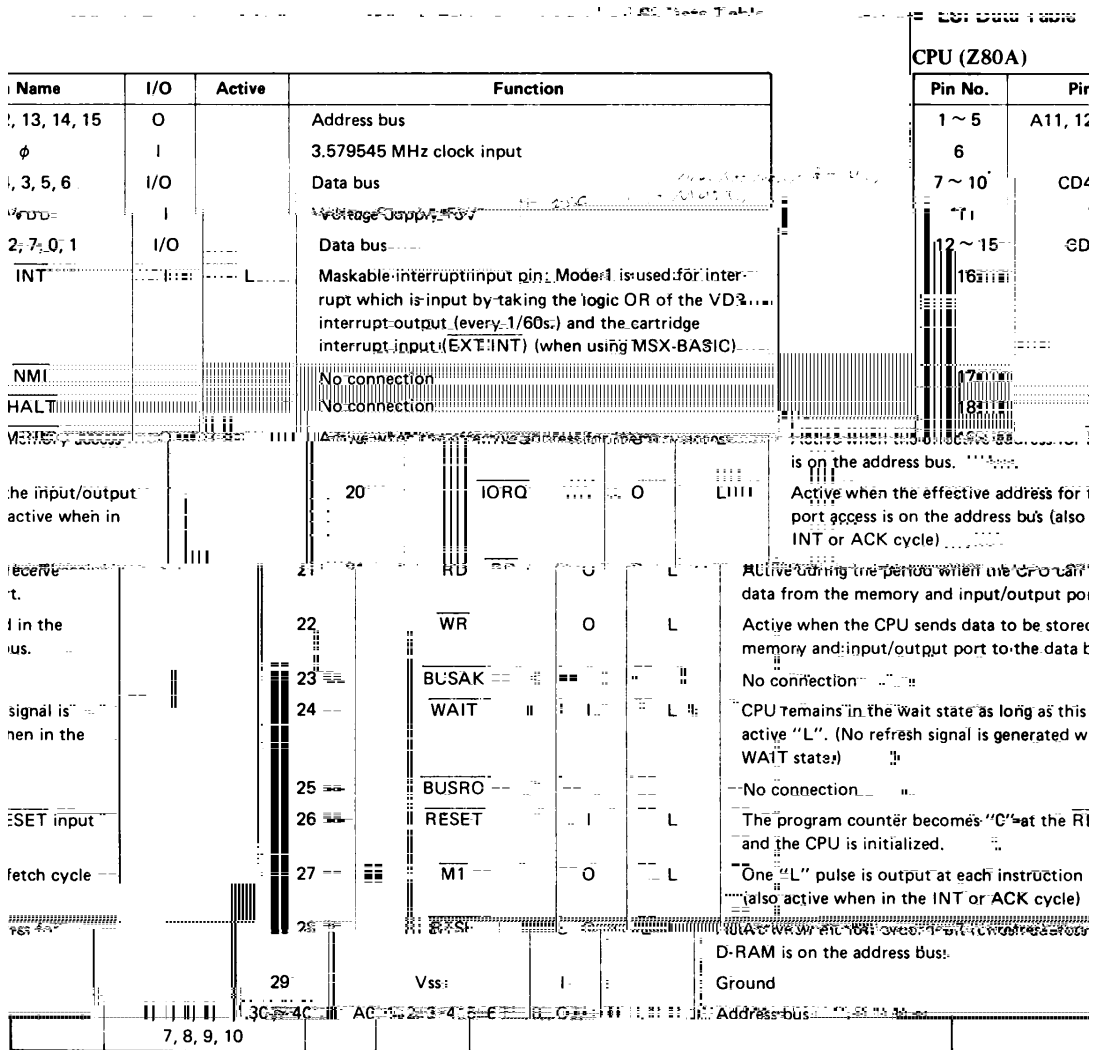

■ **Adjustments**

Adjustment	Equipment Required	Measure at	Adjust	Readings
+5V supply voltage	DVM (Digital voltmeter)	Pin #4 and 7 of connector CN2, CPU board	VR1, power supply	+5V ± 0.25V
Clock Frequency	Frequency counter	Pin # 6 of Z80A CPU	TC1, u-clock card	3.579545 MHz ± 50 Hz

NOTES: Check AC line voltage to insure that it is 120V ± 10%.
The adjustment for +5V supply voltage should be made while the circuitry of the CX-5MU is connected and the proper load resistor is terminated as shown below.
To terminate the load resistor, remove connector CN2 from the CPU board. Then if possible, insert one lead of the load resistor into pin 7 or 8 (red wire) and the other end into pin 4, 5 or 6 (black wire).
If the leads of the load are too big, you may need to use smaller gauge wire for the load resistor connection.
Load resistor value: 6.5Ω ~ 7Ω, 10W or higher.

SSG (Software Sound Generator – YM-2149)

Pin No.	Pin Names	I/O	Active	Function
1	V _{SS}			Ground
2	NC			No connection
3, 4	ANALOG CHANNEL B, A	O		Output of D/A converter
5	NC			No connection
6 ~ 13	IOB7, 6, 5, 4, 3, 2, 1, 0	I/O		Parallel data 8 bit port input/output
14 ~ 21	IOA7, 6, 5, 4, 3, 2, 1, 0	I/O		Parallel data 8 bit port input/output
22	CLOCK	I		Supplies reference time for tone, noise and envelope generator
23	$\overline{\text{RESET}}$	I	L	$\overline{\text{RESET}}$ input
24	A9	I		Fixed to "L"
25	A8	I		Fixed to "H"
26	$\overline{\text{SEL}}$		L	Selection of CLOCK frequency
27	BDIR	I		
28, 29	BC2, BC1	I		
30 ~ 37	DA7, 6, 5, 4, 3, 2, 1, 0	I/O		Data input/output
38	ANALOG CHANNEL C	O		Output of D/A converter
39	TEST1			Test pin
40	V _{DD}			Voltage Supply +5V

PPI (Programmable Peripheral Interface – μ PD8255A)

Pin No.	Pin Name	I/O	Active	Function
1 ~ 4	PA3, 2, 1, 0			Port A (BIT)
5	$\overline{\text{RD}}$	I	L	Read input
6	$\overline{\text{CS}}$		L	Chip select
7	GND			Ground
8, 9	A1, A0	I		Internal register select signal input
10 ~ 17	PC7, 6, 5, 4, 0, 1, 2, 3			Port C (BIT)
18 ~ 25	PB0, 1, 2, 3, 4, 5, 6, 7			Port B (BIT)
26	V _{DD}			Power Supply +5V
27 ~ 34	D7, 6, 5, 4, 3, 2, 1, 0			Data bus
35	$\overline{\text{RESET}}$			$\overline{\text{RESET}}$ input
36	$\overline{\text{WR}}$		L	Write input
37 ~ 40	PA7, 6, 5, 4			Port A (BIT)

RAM (MB81416-12)

Function	Pin No.	Pin Name	I/O	Active	Function	Pin No.
	1	\overline{OE}	I	L	Output enable	9
	2, 3	DQ1, DQ2	I/O		Data input/output	10 ~ 14
	4	\overline{WE}	I	L	Write enable	15
	5	\overline{RAS}	I	L	Lower address strobe	16

■ Timing Chart

■ FM Circuit Board

FM sound synthesizer unit. When used with a D/A converter (DAC), 8 audio tone signals are generated for R and L channels. The unit is also equipped with a noise generator, vibrato oscillator, amplitude effect generator and timer circuitry. 2 sets of timers are used and when a timer expires, a timer interrupt takes place.

This is a D/A converter to produce 2 channel (left and right) audio signal.

The MKS and OPM are located in SLOT # 3 000H ~ 3F7FH.

The keyboard scan function and supports MODE 2 IRQ for CPU. The data transfer rate is 31.25 K baud. Keyboard scan is a function to handle the connected music keyboard. When a key is pressed, the VECTOR ADDRESS goes out to DATA BUS.

■ LSI Function

- 1) OPM (YM2151)
FM sound generator of the signals can be obtained at the OPM. The YM2151 has 8 note channels, a modulation circuit, tonal effects, and an interrupt request.
- 2) DAC (YM3012)
As related in OPM section, 1.
- 3) ROM (YM2270-2)
Program is written to control the OPM.
- 4) MKS (YM2148)
MKS has a MIDI function, but the MIDI is a synchronous serial keyboard ON/OFF data of the keyboard. When MODE 2 IRQ takes place, the keyboard scan function is executed.
